SPECIAL APPLICATIONS

We always try to react to customer individual requirements as best as we can. Our wide product range offers incredibly many variation possibilities. Often it is sufficient to combine the right components with each other to get a product which fits ones needs. Many products would not be part of todays product range, if we had not always worked on individual solutions. Some of them have made it into our core range and are now available to all of our customers.

WE CREATE INDIVIDUAL

SPECIAL DESIGNS

The product development starts with a meeting with the customer and a detailed analysis of the application. The product requirements are defined and features are determined. We create a first draft using CAD, which than can be used for the reconcilement with the customer. 3D views quickly provide information as to whether the chosen direction leads to the goal. Once this milestone has been reached, the individual components are designed. These components form the basis for the production. More complex developments start with the construction of a prototype. We accompany the sampling, so that we can optimally consider necessary adjustments. After the final construction is created, the series can be produced.

Even with the individual product development we try to use as many standard components as possible for reaching the best price-performance ratio. Here, for example, we have been using the plastic-joining technology for several years.

DO NOT COMPROMISE!

- ✓ We create a product for you, which is exactly geared to your needs
- ✓ parts of our product range can be recombined
- ✓ existing products can be adjusted and varied

Existing plastic components, like plastic bases and intermediate shelves, can be cut and put together with new dimensions.
If, for example, only the width of the base is reduced, we can still use the standard side panels for the new rolltainer.

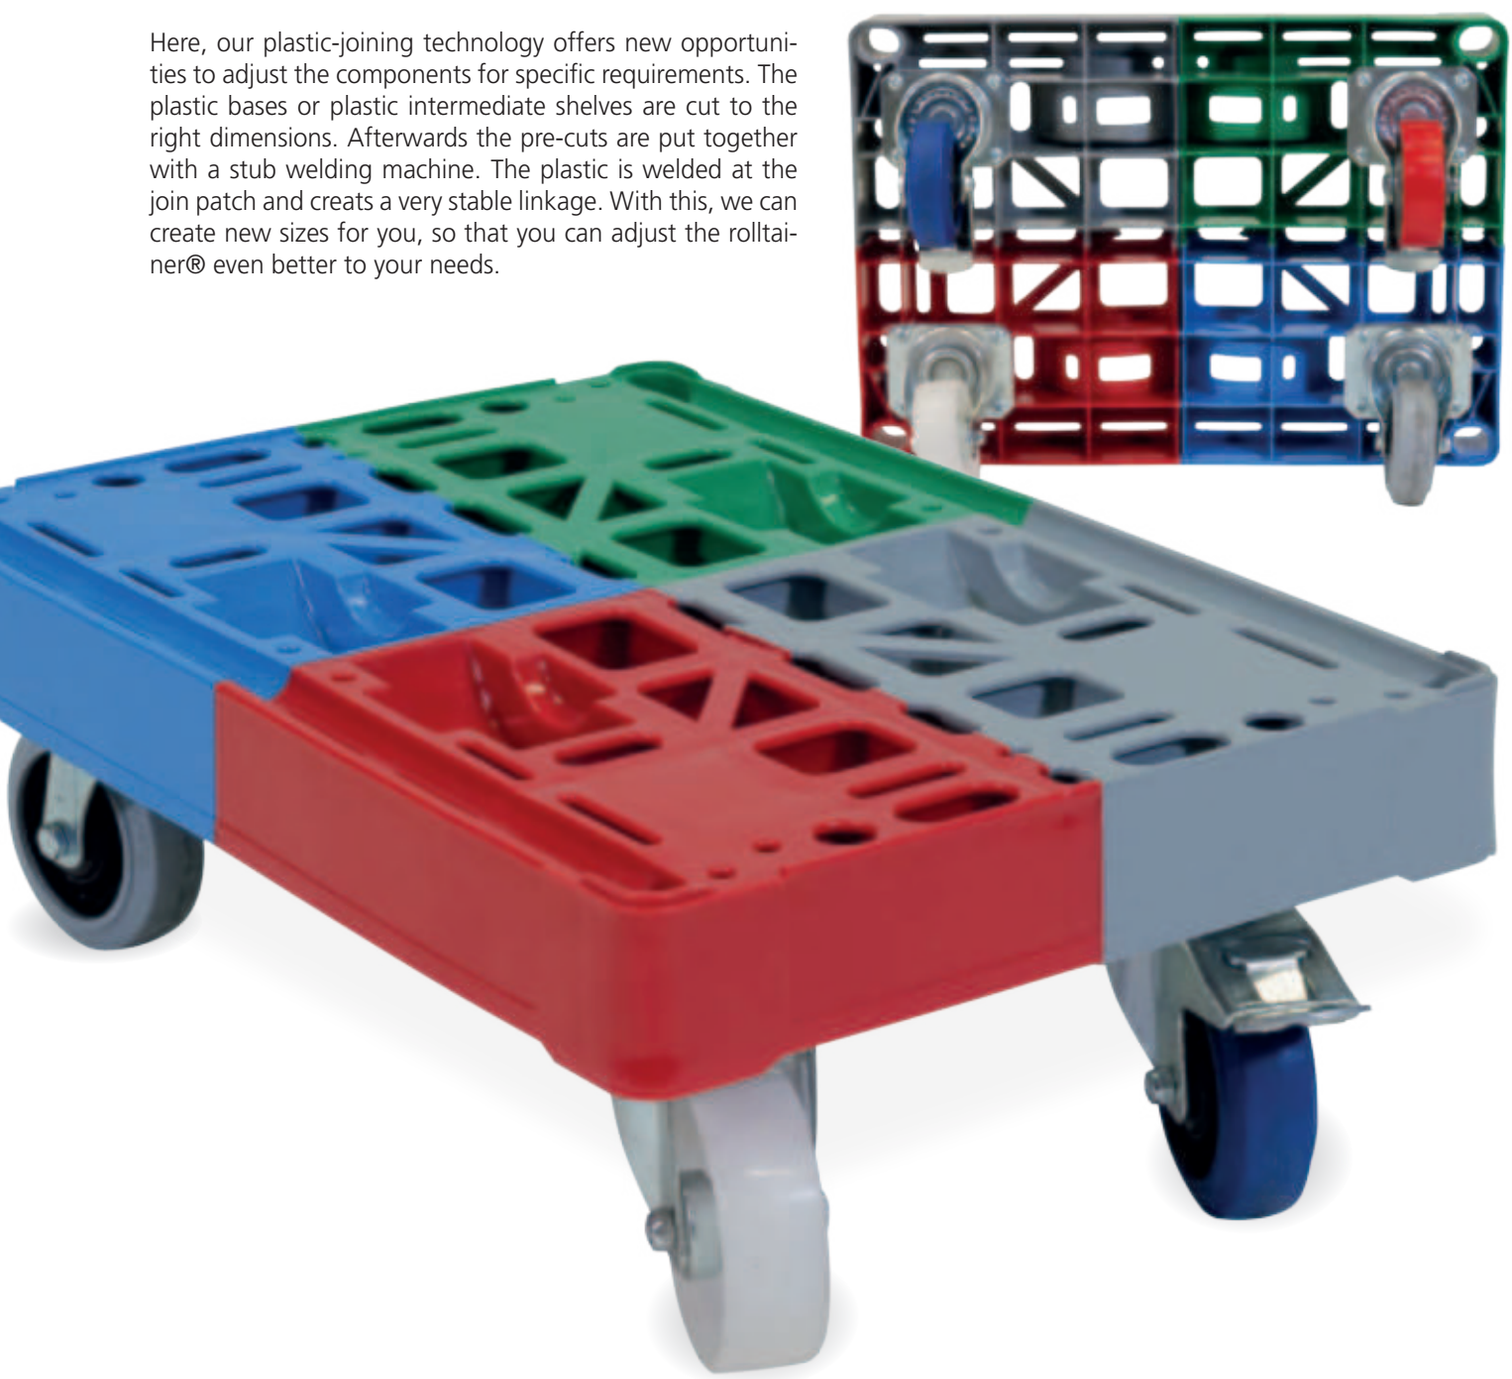
PLASTIC COMPONENTS IN **SPECIAL DIMENSIONS**

The plastic bases and intermediate shelves made of plastic are produced with the injection moulding-procedure, which means liquid plastic is inserted into a predefined form. With this procedure, there are almost no possibilities to influence the dimensions of the components. The dimensions are predetermined through the existing form.

Here, our plastic-joining technology offers new opportunities to adjust the components for specific requirements. The plastic bases or plastic intermediate shelves are cut to the right dimensions. Afterwards the pre-cuts are put together with a stub welding machine. The plastic is welded at the join patch and creats a very stable linkage. With this, we can create new sizes for you, so that you can adjust the rolltainer® even better to your needs.

Feel free to contact us. We are happy to check your needs and advise you on the existing options.



ALL BENEFITS AT A GLANCE

- ✓ individual adjustment to your needs with consistent quality
- ✓ use the versatility of our existing products for your purposes
- ✓ we will find the right solution for your requirements**!**
